## Subgroup, Generator of a Group, Cyclic Group and Properties

### 1. Subgroup

Let  $(G, *)$  be a group. A non-empty subset  $H$  of  $G$  is called a **subgroup** of  $G$  if  $H$  itself forms a group under the operation  $*$  defined on  $G$ .

#### **Subgroup Test (Necessary and Sufficient Condition):**

A non-empty subset  $H$  of a group  $G$  is a subgroup if:

1. For all  $a, b$  in  $H$ ,  $a * b$  is in  $H$  (closure).
2. For every  $a$  in  $H$ ,  $a^{-1}$  is in  $H$  (existence of inverse).

Equivalently,  $H$  is a subgroup if for all  $a, b$  in  $H$ ,  $a * b^{-1}$  is in  $H$ .

#### **Examples of Subgroup:**

1.  $Z$  is a group under addition. The set  $2Z = \{\dots, -4, -2, 0, 2, 4, \dots\}$  is a subgroup of  $Z$ .
2. In the group  $(\mathbb{R}, +)$ , the set of integers  $Z$  is a subgroup.
3. In any group  $G$ , the trivial subgroup  $\{e\}$  and  $G$  itself are subgroups.

## 2. Generator of a Group

Let  $G$  be a group and  $a$  be an element of  $G$ . The **generator** of  $G$  is an element such that every element of  $G$  can be written as a power of  $a$  (or multiple in additive notation).

The set generated by  $a$  is denoted by  $\langle a \rangle$  and is defined as:

$\langle a \rangle = \{ a^n \mid n \in \mathbb{Z} \}$  (multiplicative group)

or  $\langle a \rangle = \{ na \mid n \in \mathbb{Z} \}$  (additive group).

### Examples:

1. In the group  $(\mathbb{Z}, +)$ , the element 1 is a generator since every integer can be written as  $n \times 1$ .
2. In the group  $\{1, -1\}$  under multiplication,  $-1$  is a generator.

## 3. Cyclic Group

A group  $G$  is called a **cyclic group** if there exists an element  $a$  in  $G$  such that  $G = \langle a \rangle$ . Such an element  $a$  is called a generator of  $G$ .

### Examples of Cyclic Groups:

1.  $(\mathbb{Z}, +)$  is a cyclic group generated by 1 or  $-1$ .
2. The group  $\{1, i, -1, -i\}$  under multiplication is cyclic, generated by  $i$ .
3.  $\mathbb{Z}_n = \{0, 1, 2, \dots, n-1\}$  under addition modulo  $n$  is a cyclic group.

#### **4. Properties of Cyclic Groups**

1. Every cyclic group is abelian (commutative).
2. Every subgroup of a cyclic group is cyclic.
3. A cyclic group of order  $n$  has exactly one subgroup of order  $d$  for every positive divisor  $d$  of  $n$ .
4. If  $G = \langle a \rangle$  and  $|G| = n$ , then  $a^n = e$ , where  $e$  is the identity element.

#### **Finite and Infinite Cyclic Groups:**

1.  $(\mathbb{Z}, +)$  is an infinite cyclic group.
2.  $\mathbb{Z}_n$  under addition modulo  $n$  is a finite cyclic group of order  $n$ .

#### **Important Note:**

Cyclic groups play a fundamental role in group theory and are often used to understand the structure of more complex groups.
